

Great Circle

Incident Command for IT: What We Can Learn from the Fire Department

Brent Chapman

Great Circle

IT managers often need to manage incidents

Security incidents

Service outages

Infrastructure failures

- Power failures

- Cooling failures

- Connectivity failures

... and so forth

Great Circle

Who manages emergencies daily?

Public safety agencies

- Fire departments

 - Urban & suburban

 - Forest & wildland

- Police departments

- Coast Guard

- ... etc.

Great Circle

How do public safety agencies...

Organize themselves on the fly to deal with a major incident?

Quickly and effectively coordinate the efforts of multiple agencies?

Evolve the organization as the incident changes in scope, scale, or focus?

What can IT professionals learn from that?

Great Circle

For example...

A car hits a fire hydrant

Occupants are trapped and injured

Water from hydrant floods an underground electrical transformer, causing a short circuit & an outage

Who might be involved in response?

Fire department – rescue trapped occupants

Ambulance service – treat & transport victims

Police department – direct traffic & investigate

Water department – shut off hydrant

Electric company – deal with flooded transformer

How to coordinate all that?

Great Circle

What needs to get done?

Ambulance crew needs to treat & transport victims

But first, fire department crew needs to extricate them from wreckage

But before they can do that, water company needs to shut off water

Which they can't do until electric company safes the flooded transformer

Great Circle

How do you organize this?

Who is in charge?

How do they figure out what needs to be done, and who can do it?

How do assignments get made, so that

Everything necessary gets done

No effort gets duplicated

Everything is done safely

Great Circle

An even bigger example: Southern California Wildfires

Fast-changing situation

- Fire grows and moves as weather and winds shift

- Plan evolves as situation & resources change

Many agencies involved

- Firefighters from dozens of cities, plus CDF, USFS, BLM, and military

- Airborne water drop, transport, & scouting

- Law enforcement to deal with residents

- Support units (medical, kitchens, camps, fuel, etc.)

Great Circle

How about an IT example?

Data center outage — total power failure

Utility service dropped, UPS didn't take load, generator didn't start in time

All systems went down hard (no shutdown)

Need to

Ensure services transferred to alternate data center

Cold-start everything; figure out startup order

Check/fix systems as they're brought back up

Diagnose and permanently fix power problem

Transfer services back from alternate data center

Might take days, involve dozens of people

Great Circle

Other IT examples

Service outages

Security incidents

- DoS attacks

- Virus/worm outbreaks

- Break-ins

Adversarial terminations; layoffs

Not just emergencies

- Facility moves

- Service deployments

- Major upgrades

Great Circle

What do these types of incidents have in common?

Timing might be a surprise

Situation not perfectly understood at start

Learn as you go, and adjust on the fly

Resources change over time

People come and go; not all together at start

Need ways to bring newcomers up to speed

Need ways to transfer responsibilities

Great Circle

So, what is ICS?

Incident Command System

Standardized organizational structure and set of operating principles

Tools for command, control, and coordination of a response to an incident

Provides means to coordinate efforts of multiple parties toward common goals

Uses principles that have been proven to improve efficiency and effectiveness

Great Circle

History of ICS

Developed in 1970's to coordinate agencies dealing with yearly SoCal wildfires

Has evolved since into national standard

Now used by nearly all US public safety agencies

Often required, to obtain state/Federal funding

Great Circle

Key ICS Principles

Modular & scalable organization structure

Manageable span of control

Unity of command

Explicit transfers of responsibility

Clear communications

Consolidated incident action plans

Management by objective

Comprehensive resource management

Designated incident facilities

Great Circle

Key Principle #1: Modular & scalable organization structure

Functions are activated as needed for a particular incident

- All incidents will have a Command Section

- Almost all will have an Operations Section

- Rest of sections are only used on larger/longer incidents

On small incidents, multiple functions often handled by single person

Great Circle

Command Section

Incident Commander (IC) responsible for overall management of incident

IC initially also performs all 4 section chief roles (Operations, Logistics, Planning/Status, Admin/Finance), until delegated to somebody else

Great Circle

Operations Section

This is where the real work happens

Operations develops and executes plans to achieve the objectives set by Command

Assists Command in development of Consolidated Incident Action Plan

Typically the biggest section, by number of people

Ops focus is now; Planning worries about later

Great Circle

Planning/Status Section

Collects & evaluates info needed to prepare action plan

Forecasts probable course of incident

Plans for next day, next week, etc.

Keeps track of what has been done, and what still needs to be done

Keeps “current status & plans” info up to date, so that new arrivals can brief selves

Great Circle

Logistics Section

Responsible for obtaining all resources, services, and support required to deal with the incident

Responsibilities include facilities, transportation, supply, equipment maintenance & fueling, feeding & medical care of incident response personnel, etc.

Is more important on big, long-running incidents; may not be needed on small or short incidents

Great Circle

Admin/Finance Section

Responsible for tracking incident-related costs (including time & materials, if necessary for reimbursement)

Also administers procurements arranged by Logistics

Usually only activated on the very largest and longest-running incidents

Great Circle

Growing the ICS organization

Initially, the senior-most first responder is the Incident Commander (IC)

IC responsibility may transfer to somebody else later, as incident grows, but that isn't automatic

Generally better to keep the same IC, if feasible

Stuff gets lost during handoffs

If IC transfer does happen, it needs to be explicit

One person often fills multiple slots on org chart

Initially, IC also heads other sections (Ops, etc.)

Delegates to others as necessary and possible

Great Circle

Key Principle #2: Manageable span of control

Each supervisor should
have 3-7 subordinates

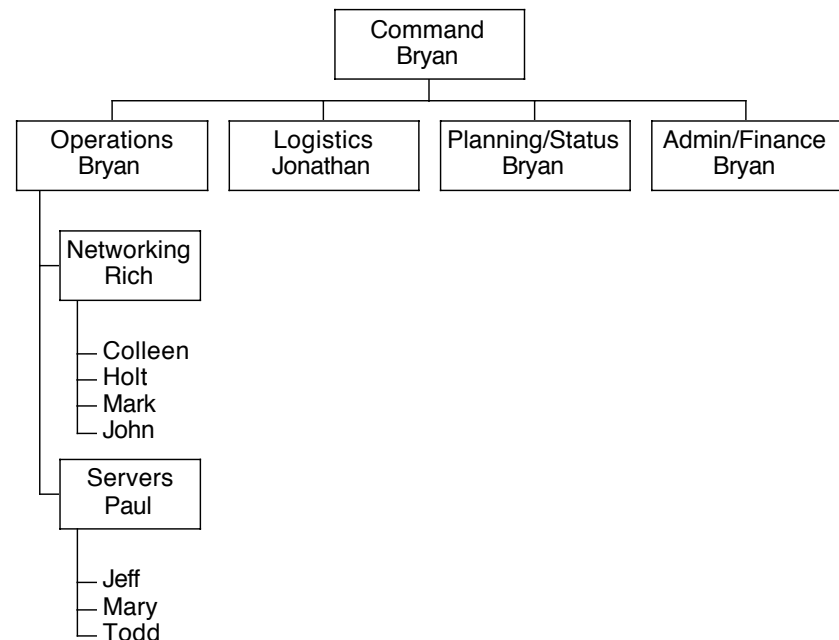

5 is ideal

When necessary, as
org grows, create new
levels

Division might be

Functional

Geographic

Great Circle

Key Principle #3: Unity of command

On incident, each person has 1 boss

- Strict tree structure, all the way to the top

- Everybody knows who they work for

- Every supervisor knows who works for them

Works better than matrix in an emergency

- Doesn't assume folks normally work together, or even know each other

Makes communication & coordination easier,
up/down tree, as organization grows & changes

Reduces freelancing

Great Circle

Key Principle #4: Explicit transfers of responsibility

Changes to organization are made explicitly

More senior person doesn't automatically take over upon arrival

Might, but only after briefing on status/plans from person they're replacing, and explicit turnover (including notifying subordinates and superiors)

Person already in place is often better suited to handle current situation, and certainly is more up to speed

Planning/Status keeps overall org chart updated

Great Circle

Key Principle #5: Clear communications

Communicate clearly and completely, not in code

- Reduces potential for confusion

- Reduces time spent clarifying

- Lets other people (including management) monitor

Talk directly to resources, when possible

- Use the tree to find, then work with them directly

- Using tree also helps keep management informed

Great Circle

Key Principle #6: Consolidated action plans

Command communicates top-level action plan for current operational period (hour, shift, day, etc.)

Plan states, at a high level, what organization is trying to accomplish right now

Section chiefs (Ops, Logistics, etc.) help develop plan

Written plan is best

Makes it easier to keep everybody on target

Makes it easier for new arrivals to brief selves

Rule of thumb: if it crosses organizational or specialty boundaries, write it down

Great Circle

Key Principle #7: Management by objective

Tell people what you want to accomplish, not how

Let them figure out how to get it done

Gives them room to flexibly and creatively cope with changing circumstances

For example, say “get a public web server back online with an ‘out of service’ notice for our customers”, not “take host xyz123, reload it with RedHat and Apache, move it to rack 7, ...”

Is generally faster to communicate, and the folks doing the work may know a better way than you

Great Circle

Key Principle #8: Comprehensive resource management

All assets & personnel need to be tracked

- So new resources can be used most effectively

- So existing resources can be relieved

Folks should “sign in” through Admin function, then wait for assignment

- Helps ensure they’re put to best use

- Might want to designate a “report to” site

- Also simplifies briefing new arrivals

Great Circle

Key Principle #9: Designated incident facilities

Command Post (CP) is key facility to identify – that’s where everybody can expect to find IC

If IC needs to leave CP, needs to transfer IC responsibility (temporarily or permanently) to someone who’ll still be there

Also useful to designate “staging area” for new resources to report to upon arrival, for sign-in and assignment; may be at CP

Great Circle

ICS for IT in action...

It's a Tuesday morning, and everything is normal
The company's load is split 50/50 between its two data centers, in Sunnyvale and Mesa

At about 9:30am, the NOC loses all monitoring of Sunnyvale, and the load doubles in Mesa

The NOC suspects a network outage, begins to troubleshoot, and pages all NetOps managers, per their SOP

Bryan, the Director of Operations, happens to be nearby, and diverts to the Sunnyvale DC

Great Circle

9:45am

Bryan arrives at the DC at about the same time as Joe and Tom, two of the company's installers

In the parking lot, they notice that the facility's generator is running

Inside, they find that the lights are on, but all of the UPS-powered equipment (servers, network, etc.) is without power

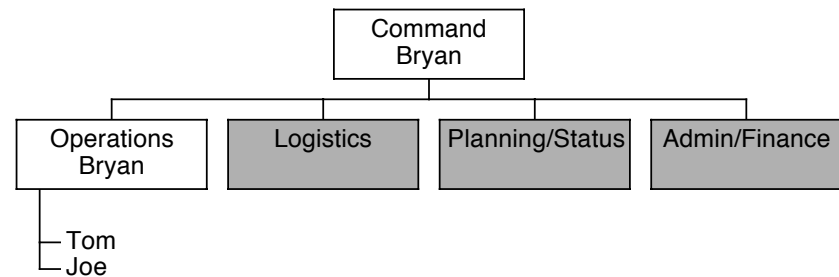

Great Circle

First steps...

Bryan calls the NOC:

- 1) Informs them he's activating ICS plan [clear communication]
- 2) Asks them to page all NetOps personnel to report to DC conference room for assignment [staging area]

Bryan directs Joe and Tom to switch off all systems, then investigate power problems. [serving in multiple roles; management by objective]

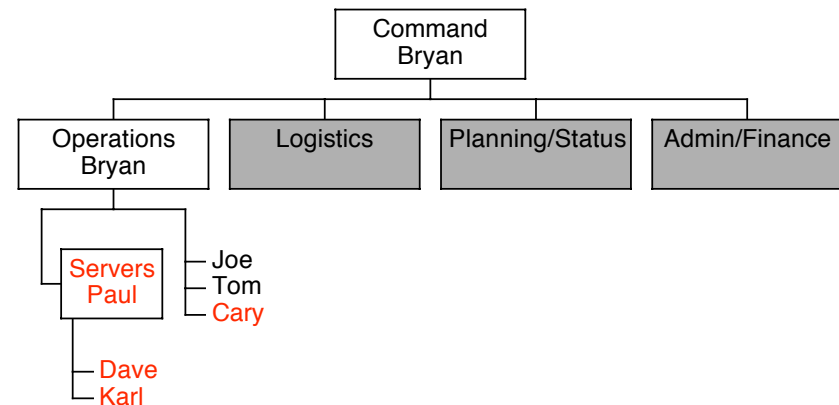

Great Circle

10:15am

Cary, the facilities manager, arrives. Bryan asks him to take charge of investigating the UPS failure, while Joe and Tom continue to switch off systems to prevent unplanned restarts.

Paul (the server team manager), Dave, and Karl (server sysadmins) arrive. Bryan asks Paul to direct them in preparing to bring servers back online.
[span of control]

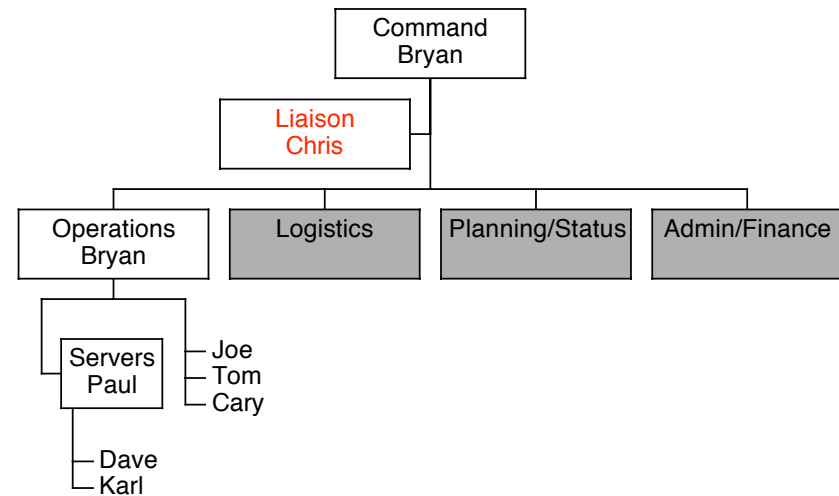

Great Circle

10:30am

Chris, the NetOps VP, arrives.
After a brief discussion with Bryan, they decide it makes most sense for Bryan to remain as IC, and for Chris to serve as liaison to rest of company.
[explicit transfer of responsibility, not automatic upon arrival of more senior personnel]

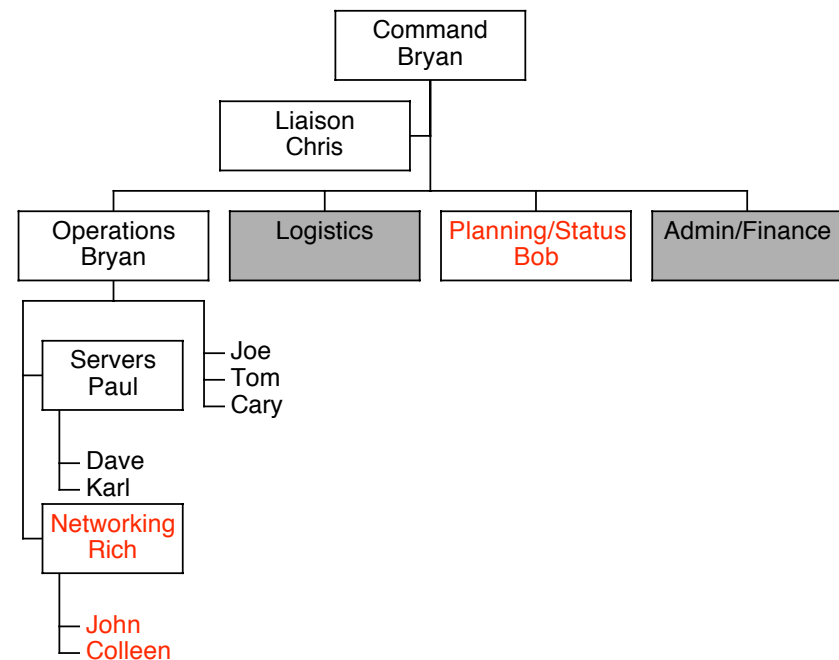

Great Circle

10:45am

Rich, Colleen, and John from the Networking team, and Bob (the Networking team manager) arrive.

Bryan asks Rich to take charge of Colleen and John as the Networking team on this incident, and asks Bob to handle Planning/Status for the overall incident.
[comprehensive resource management, using folks where most needed]

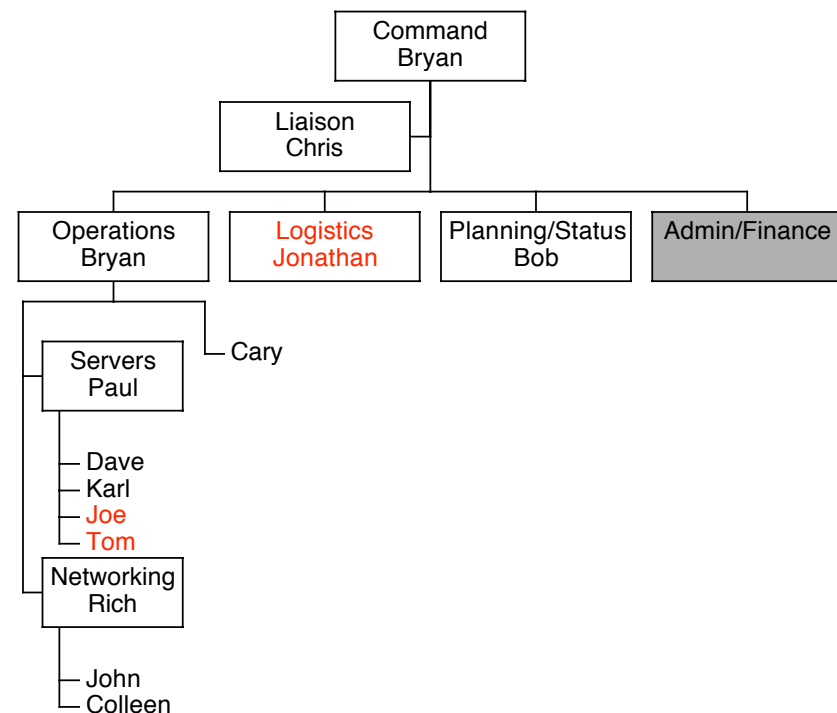

Great Circle

11:00am

Paul needs more help with servers, so Bryan reassigns Tom and Joe to Paul's team. [comprehensive resource management]

Cary determines that they may need to run on generator power for several days, but that the fuel tank isn't big enough for that. Bryan calls Jonathan, the group's purchasing agent, and asks him to take on the Logistics role and arrange for refueling (& lunch!). [modular, expandable organization]

Great Circle

And so forth...

The organization changes, as the situation
and resources change

Following the ICS principles gives you a
way to keep it all under control

Could keep this going indefinitely, if needed

Great Circle

ICS Tips

Establish ICS early in an incident

If you get off to a disorganized start, you'll be playing catch-up forever

Think of ICS as a toolbox full of tools

Choose the tools you need for the incident at hand

Keep it simple

Practice ICS at every opportunity

If you use it for “routine” and pre-planned events like moves, upgrades, and deployments, your team will be more comfortable using it for “surprise” events like outages and security incidents
